Event Stream Processing & Real-Time Analytics

Author: [Principal Streaming Architect] | 15-Part Research Monograph

Abstract & Introduction

Real-time stream processing engines enable immediate processing of high-throughput telemetry using partitioned logs, windowing functions, and exact-once semantics.

> **Scope:** Kafka, Flink, Partitioning, Windowing, CDC, and Event Sourcing.

Table of Contents

1. Foundations of Event Streaming and Immutable Log Architectures
2. Partitioning Strategies, Key Design, and Consumer Group Dynamics
3. Exactly-Once Processing Semantics and Transactional Outbox Pattern
4. Stream-Table Duality and State Management in Stream Processors
5. Windowing Operations: Tumbling, Sliding, and Session Windows
6. Schema Evolution, Compatibility Rules, and Confluent Schema Registry
7. Change Data Capture (CDC) from Relational Databases to Event Logs
8. Stream Joins: Stream-Stream and Stream-Table Enrichments
9. Message Serialization Formats: Avro, Protobuf, and JSON Schema
10. Operational Monitoring, Lag Metrics, and Broker Tuning
11. Multi-Region Mirroring and Active-Active Event Replication
12. Security, Topic ACLs, and Encryption in Transit and at Rest
13. Data Governance, Lineage, and Cataloging in Streaming Systems
14. Case Studies: Real-Time Fraud Detection and Financial Telemetry
15. Future Outlook: Serverless Stream Processing and AI Agent Integration

Full 15-Page Monograph Summary

Complete analysis of event streaming topologies, windowing mechanics, broker tuning, and distributed log synchronization across 15 structured sections.
