Advanced Kubernetes Operations & Cluster Lifecycle

Author: [Principal Platform Architect] | 15-Part Research Monograph

Abstract & Introduction

Production Kubernetes operations require deep control plane tuning, etcd disaster recovery, advanced scheduling, admission webhooks, and eBPF network acceleration.

> **Scope:** Control Plane, etcd, CRDs, Webhooks, eBPF CNI, and Karpenter Autoscaling.

Table of Contents

1. Kubernetes Control Plane Architecture and Component Tuning
2. etcd Database Internals, Snapshot Backup, and Quorum Recovery
3. Advanced Scheduler Configuration: Taints, Tolerations, and Node Affinity
4. Custom Resource Definitions (CRDs) and Controller Pattern Design
5. Admission Webhooks: Validating and Mutating Controllers
6. Container Runtime Interfaces (CRI) and Secure Sandbox Runtimes
7. Persistent Storage Management, CSI Drivers, and Dynamic Provisioning
8. Network Policy Enforcement and eBPF Data Plane Acceleration
9. Cluster Upgrades, Version Skew Policies, and Zero-Downtime Patching
10. Resource Quotas, Limit Ranges, and Multi-Tenant Isolation
11. Node Autoscaling, Cluster Autoscaler, and Karpenter Optimization
12. Cluster Observability, Prometheus Operator, and CoreMetrics
13. Security Hardening, CIS Benchmarks, and Falco Runtime Security
14. Disaster Recovery and Cluster State Migration Strategies
15. Future Outlook: AI-Driven Self-Healing Clusters and Virtual Clusters

Full 15-Page Monograph Summary

Comprehensive exploration of etcd recovery, eBPF networking, admission controllers, and automated cluster lifecycle management.
