GitOps & Progressive Delivery Pipelines

Author: [Principal Delivery Architect] | 15-Part Research Monograph

Abstract & Introduction

GitOps uses Git as the single source of truth for declarative deployments, paired with ArgoCD, Flux, and canary rollouts.

> **Scope:** ArgoCD, Flux, Canary Rollouts, Sealed Secrets, and Terraform IaC.

Table of Contents

1. Principles of GitOps and Declarative Infrastructure Management
2. Reconciliation Engines: ArgoCD vs. Flux Architecture
3. Monorepo vs. Polyrepo Strategies for GitOps Repositories
4. Secret Management in GitOps: Sealed Secrets and SOPS
5. Progressive Delivery: Canary Deployments and Blue-Green Rollouts
6. Automated Rollback Triggers and Metric-Driven Validation
7. Feature Flag Integration and Decoupling Deployment from Release
8. Multi-Cluster GitOps Topologies and App-of-Apps Patterns
9. CI/CD Pipeline Integration: GitHub Actions and Tekton
10. Infrastructure as Code (IaC) with Terraform and OpenTofu
11. Policy Validation in CI/CD with Conftest and OPA
12. Auditability, Compliance, and Change Management Reporting
13. Disaster Recovery and Cluster State Restoration via Git
14. Enterprise Adoption Case Studies and Migration Playbooks
15. Future Outlook: AI-Assisted Deployment Optimization and Self-Healing Git

Full 15-Page Monograph Summary

Comprehensive analysis of reconciliation loops, ArgoCD app-of-apps patterns, and canary progressive delivery strategies.
